

DISTCOM 2 IS ABOUT ERROR
CORRECTION

REPETITION

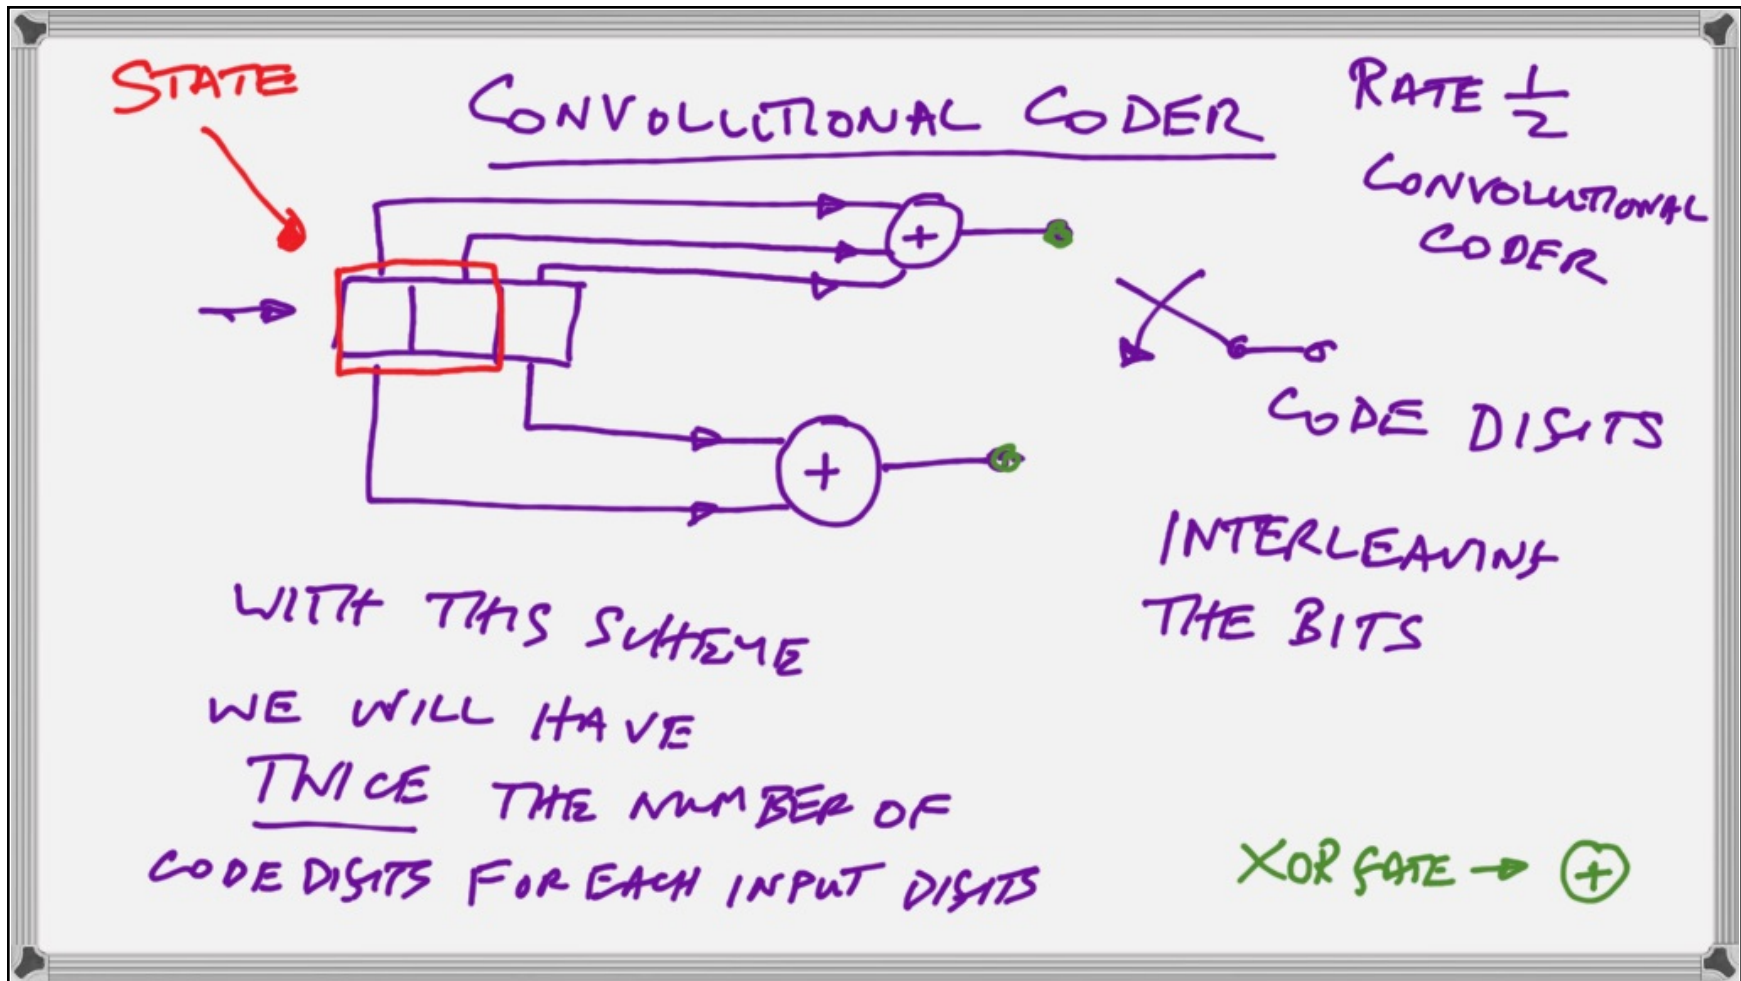

- * ADVANTAGE IS SIMPLICITY
- * DISADVANTAGE IS WASTED BANDWIDTH
(CHANNEL CAPACITY)

ERROR-CONTROL CODING

BLOCK CODES VERSUS CONVOLUTIONAL CODES

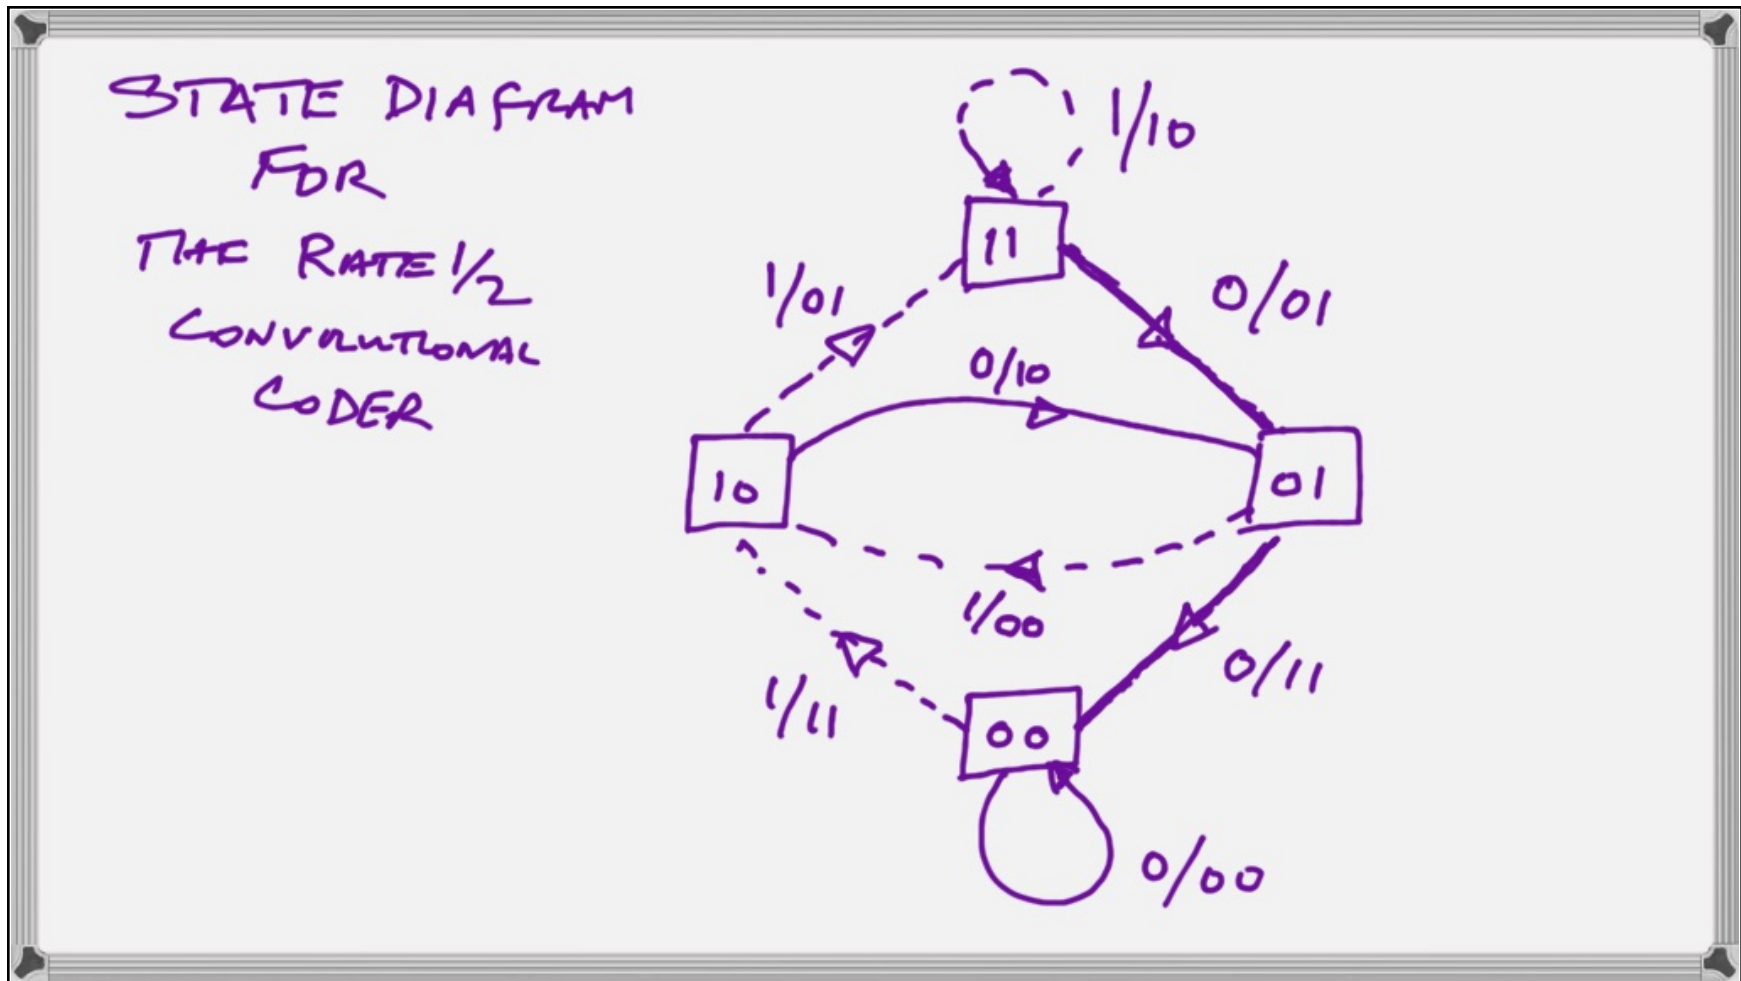

↓
BREAK INPUT STREAM
INTO BLOCKS AND PROCESS

↓
WORKS "ON-THE-FLY"

INPUT 1 0 0 1 1
 STATE 10 01 00 10 11
 OUTPUT 11 10 11 11 01

STATE TABLE

<u>INPUT</u>	<u>INITIAL STATE</u>	<u>FINAL STATE</u>	<u>OUTPUT CODE</u>
0	00	00	00
1	00	10	11
0	01	00	11
1	01	10	00
0	10	01	10
1	10	11	01
0	11	01	01
1	11	11	10

WE CAN USE GENERATOR POLYNOMIALS
TO DESCRIBE THE TAP CONNECTIONS TO THE
SHIFT REGISTER

THE UPPER BRANCH HAS

$$f^{(1)}(D) = 1 + D + D^2$$

THE LOWER BRANCH HAS

$$f^{(2)}(D) = 1 + D^2$$

$D = \text{DELAY}$
ELEMENT

FOR A RATE $\frac{1}{2}$ CODE WITH CONSTRAINT LENGTH k , THE GENERATOR POLYNOMIALS LOOK LIKE
 $G^{(1)}(D) = g_0^{(1)} + g_1^{(1)}D + \dots + g_{k-1}^{(1)}D^{k-1}$
 $G^{(2)}(D) = g_0^{(2)} + g_1^{(2)}D + \dots + g_{k-1}^{(2)}D^{k-1}$

WHERE THE COEFFICIENTS OF THE POLYNOMIALS $g_i^{(j)}$ ARE EITHER 0 OR 1 DEPENDING ON THE SHIFT REGISTER CONNECTIONS.

NOTE THAT THE PLUS SIGNS IN THESE EQUATIONS AND IN ALL THE EQUATIONS TO DEAL WITH THIS TOPIC ARE ACTUALLY MODULO-2 ADDITION (WHICH IS \oplus XOR)

THIS SIMPLY MEANS THAT $D^x + D^x = 0$ WHERE x IS AN INTEGER
